

# Model 3: Self Sovereign Identity

**Blockchain**

Users and organizations can present **digitally signed claims** related to them, which have been **signed** by a new role in the system: the **Identity Certifier**. The verification process of the signed claims is automatic and with **no intermediary needed**

The **Self Sovereign** model allows the creation of a system in which **identity** and its **related claims** (so anything «linkable» to an identity, such as a diploma) are **totally given back to the user**. There is **no central authority** needed in order for the system to work.

Each of these is a **claim** of the user.
